

Nonparametric spec test (smoothing spline, GCV) — BKL in-CI: 25% of freqs | Leland in-CI: 90% of freqs
Practical range $N \in [20, 80]$: BKL FAIL, Leland PASS — $N=5,000$ paths $\times$ 20 freqs (100K total), $B=1,000$ bootstraps

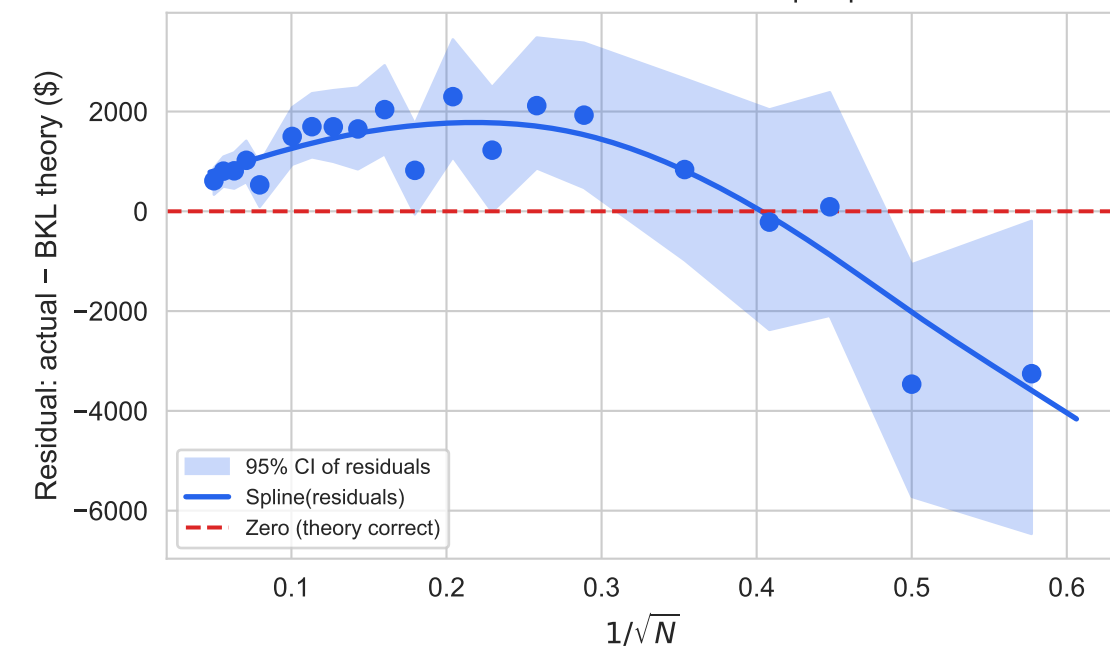

BKL variance scaling — FAIL: theory outside CI

Leland bias convergence — PASS: theory within CI

BKL residuals — zero in band $\leftrightarrow$ spec passes

Leland residuals — zero in band $\leftrightarrow$ spec passes
