

Nonparametric spec test (smoothing spline, GCV). BKL in-CI: 25% of freqs. Boyle-Emanuel in-CI: 90% of freqs.
Practical range $N \in [20,80]$: BKL FAIL, Boyle-Emanuel PASS. $N=5,000$ paths $\times$ 20 freqs (100K total), $B=1,000$ bootstraps.

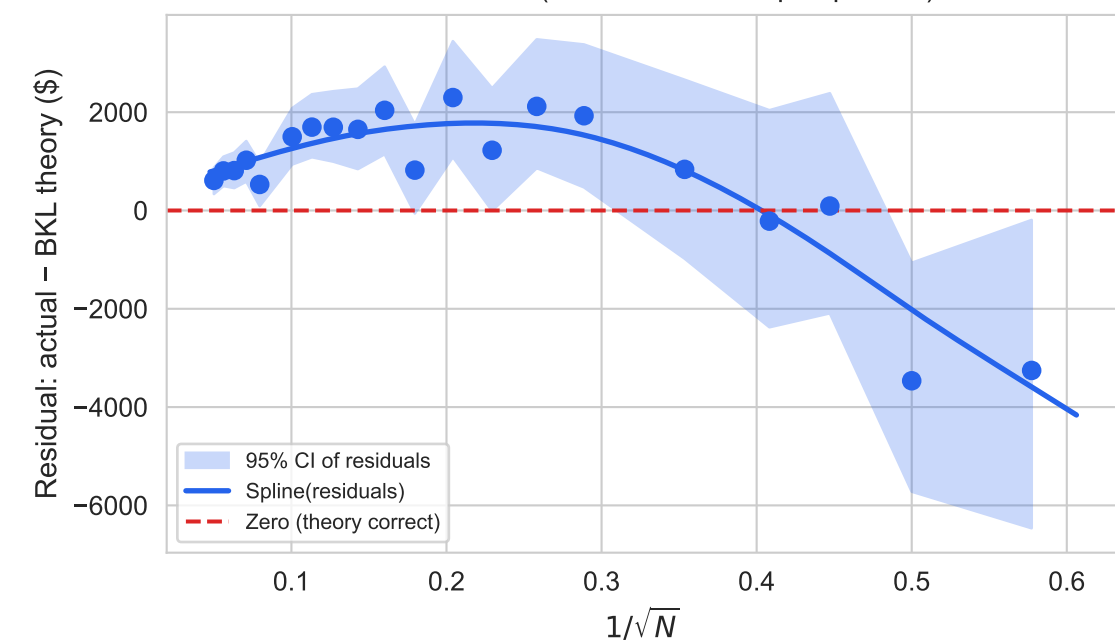

BKL variance scaling: FAIL, theory outside CI

Boyle-Emanuel $O(\Delta t)$ bias: PASS, theory within CI

BKL residuals (zero in band $\Leftrightarrow$ spec passes)

Boyle-Emanuel residuals (zero in band $\Leftrightarrow$ spec passes)
